

12-Lead

in the acute coronary syndromes

The 12-lead ECG has become the gold standard in the prehospital assessment of patients suspected to be having an acute coronary syndrome (ACS). By performing a 12-lead early, the paramedic may detect the onset of an ST-segment elevation myocardial infarction (STEMI) therefore providing care and expeditious transport to an appropriate facility.

This 16-hour course, developed by Tim Phalen, Gary Denton, and associates, is broken down into modules that may be offered as one course, or over time. The modules include: Essential Interpretation, Acquisition and Transmission, ACS Part I and Part 2, The High Acuity Patient, Bundle Branch Block and the ACS Imitators.

12-LEAD IN THE ACSs

CALL!

Course # 400009

Students must purchase the workbooks through LPCCN, they are an important part of the program.
